

FasterCap 2D Input Files

Straight segment definitions ('S' statement)

Syntax: S <condname> <x1> <y1> <x2> <y2>

The 'S' element at the beginning of a line defines a straight segment. If the segment belongs to a conductor surface, the <condname> parameter is used to associate the segment to a parent conductor named <condname>. If the segment belongs to a dielectric surface, the <condname> parameter is ignored. The $(x1, y1)$, $(x2, y2)$ 2D points specify the coordinates of the two end points of the segment.

Example 1:

```
S circle 0.1 0 0.098768907 0.015642989
```

This input file fragments specifies a segment of the surface of a conductor, whose name is `circle`.

Example 2:

```
S inner_shell 0.098768907 0.015642989 0.095105938 0.030900818
S outer_shell 0.095105938 0.030900818 0.089101283 0.045397812
S inner_shell 0.089101283 0.045397812 0.080902789 0.058777026
```

This input file fragments specifies two segments of the surface of a conductor, whose name is `inner_shell`, and one segment of the surface of a second conductor, whose name is `outer_shell`.
